

BDD Scenarios: Login Feature

Document version: 1.0

Date: July 6, 2026

Project: RetryPlaywright

Feature scope: Login only

Feature: Login

As a customer of the ecommerce platform
I want to authenticate with my account credentials
So that I can access the product dashboard and place orders

Background:

Given the user is on the ecommerce login page

@login @positive @smoke

Scenario: Registered user logs in successfully

When the user logs in with a registered email and valid password
Then the user should be redirected to the product dashboard
And the product catalog should be visible

@login @negative

Scenario: Unregistered user cannot log in

When the user logs in with an unregistered email and a valid-format password
Then an authentication error alert should be displayed
And the alert message should be "Incorrect email or password."
And the user should remain on the login page

@login @negative

Scenario: Registered user enters an incorrect password

When the user logs in with a registered email and an incorrect password
Then an authentication error alert should be displayed
And the user should remain on the login page

@login @validation

Scenario: User submits login form with blank email

When the user submits the login form without entering an email
Then an email validation message should be displayed
And the login request should not be submitted

@login @validation

Scenario: User submits login form with blank password

When the user enters a valid email
And the user submits the login form without entering a password
Then a password validation message should be displayed
And the login request should not be submitted

@login @validation

Scenario: User submits login form with invalid email format

When the user enters an invalid email format
And the user enters a valid-format password
And the user submits the login form
Then an email format validation message should be displayed
And the user should remain on the login page

@login @accessibility

Scenario: Login error is announced accessibly

When the user logs in with invalid credentials

Then the authentication error should be exposed as an alert

And assistive technology should be able to read the error message

@login @navigation

Scenario: User navigates to password recovery

When the user selects the forgot password link

Then the user should be redirected to the password recovery page

@login @navigation

Scenario: User navigates to registration

When the user selects the register link

Then the user should be redirected to the registration page
